NON-SURGICAL FACELIFT

LASER FACELIFT & PROFOUND MICROLIFT

When considering any changes to your face, make sure to consult a true specialist. The last thing you want is uncertainty when it comes to outcomes and results. The field of facial rejuvenation has advanced substantially over the past decade, and a large variety of surgical and non-surgical options are now available. Although surgery is typically more effective and longer lasting, the results from non-surgical treatments can be quite impressive.

WHAT IS A LASER FACELIFT?

There is no single definition for a laser facelift. Some physicians will use this term to describe a regular facelift, which utilizes a laser for some portions of the procedure just as a scalpel would be used. Others use this term to describe a facelift combined with laser resurfacing of the skin. Some physicians will use the term laser facelift to describe deep skin heating techniques, which can give some of the improvements you see with a classic facelift.

WHAT IS A MICRO FACELIFT?

Just as with a mini-facelift or a laser facelift, there is no single definition for a micro facelift. Dr. Talei uses this term to describe the changes you can realistically expect from his laser facelift. Other surgeons may use this term to describe the vampire facelift, using PRP or to describe various types of thread lifts. Dr. Talei does not typically perform those types of procedures given their low rate of success and high rate of variability from patient to patient. What is the recovery or down time for a laser facelift? When undergoing extensive radio frequency tightening, you can expect 5 days of facial swelling. If the neck is treated, you can expect the same. There is not much maintenance during this time that patients need to worry about. If superficial laser resurfacing is performed at the same time with a fractionated laser, some further skin care may be required as the superficial layer of skin peels.
